Diagnosis		
Diagnostic Trouble Code (DTC) Memory	12/1	• Multi-contour seat (OSB), (pressure) – control of the working pressure via pressure switch in the PSE, as soon as the ignition ON signal is received via the CAN-interface. (OSB for model 210 only).
Recalling Actual Values with HHT	13/1	• Manifold Vacuum Assist (MVA), (vacuum) – control of the working vacuum via pressure switch in the PSE, as soon as the ignition ON signal is received via the CAN-interface. (MVA for model 210 only).

Notes:		
The PSE provides pressure or vacuum for the following systems:		
• Central locking (CL), (pressure or vacuum) – activation via remote central locking (RCL), interior switch (CL) (S6/1s2) and via mechanical key.		
• Remote trunk release (RTR), (pressure) – activation via remote trunk release switch (S15) or via remote central locking (RCL). (RTR for model 210 sedan only).		
• Retractable rear head restraint (RHR), (vacuum) – activation via RHR unlocking switch (S6/1s3). (RTR for model 210 sedan only).		
Diagnostic Trouble Code (DTC) Memory		
• Pneumatic as well as electrical faults of the systems (CL, OSB, MVA, RTR and RHR) are recognized by the PSE and in the DTC memory. The DTC memory which has been integrated into the combination control module (N10-1 or N10-3). DTC memory can only be readout and erased using the Hand-Held-Tester (HHT).		
⚠ CAUTION!		
Erasing the Combination Control Module (N10-1 or N10-3) DTC memory, will also erase the DTC memory for the Convenience Feature (CF) and Mirror, steering column adjustment, heated mirrors (MSC).		
Additional components of the PSE:		
• Heated rear window relay		
• ATA control module		
Replacement of the combination control module (N10-1 or N10-3):		
• Combination control modules being replaced must be programmed and version coded prior to connecting to the vehicle electrical system. Please review D.M., Body and Accessories, Vol. 1, section 2, 31, for details.		

Diagnosis – Diagnostic Trouble Code (DTC) Memory (PSE)

Preparation for Test:

1. Fuses for PSE system and PSE control module ok,
2. Battery voltage 11 – 14 V,
3. Unlock vehicle via remote central locking,
4. Ignition: **ON**
5. Connect the Hand-Held Tester (HHT) to X11/4, according to diagram, see section 0.

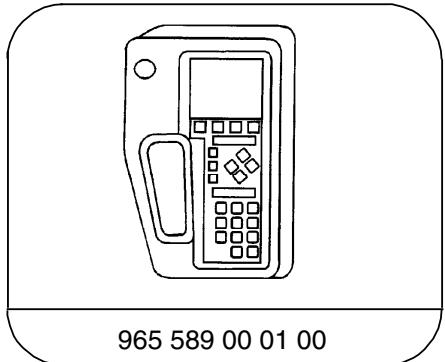

Readout DTC memory and note failure codes.

Perform repairs of noted failures as per fault table.

Interrupt PSE control module power supply for approx. 3 seconds to erase safety memory.

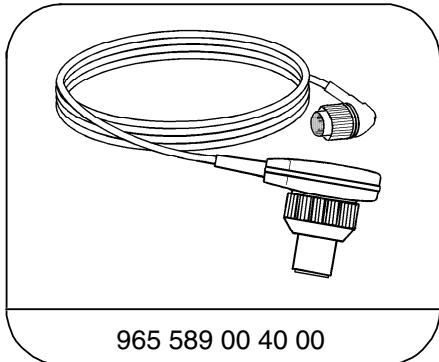

Since the DTC memory has been integrated into the combination control module (N10-1 or N10-3), DTC memory must be erased after replacement of the PSE control module.

Diagnosis – Recalling Actual Values with HHT

The following tests and activations are possible **via the Hand-Held Tester**.

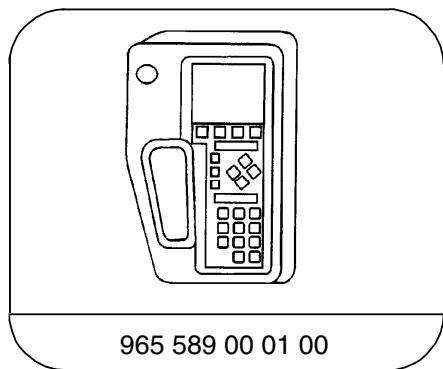

Actual values (functional condition)

- Interior switch (CL) (S6/1s2)
- RHR unlocking switch (S6/1s3)
- Left front door switch (S17/3)
- Right front door switch (S17/4)
- Remote trunk release switch (S15)
- Remote trunk release active status
- REST activated

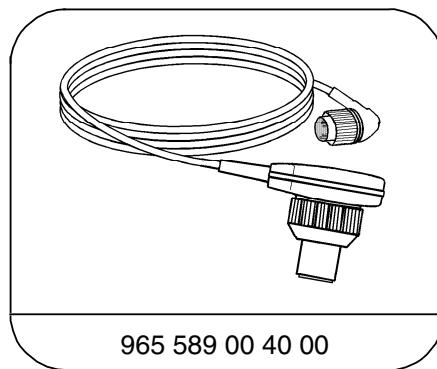

Preparation for Test:

1. Fuses PSE system and PSE control module ok,
2. Battery voltage 11 – 14 V.
3. Ignition: **ON**
4. Connect the Hand-Held Tester (HHT) to X11/4, according to diagram, see section 0.

Notes:

1. Before testing the safety switch time of the consumers, as well as between the tests for **OSB** (pressure) and **MVA** (vacuum), interrupt the PSE control module power supply for at least 3 seconds.
2. After completing the **PSE** control module test, do not operate any system which would require vacuum or pressure for approx. 10 minutes.
3. The connections on the PSE control module are marked with their German acronyms. Reference to these connections in this test are made to their U. S. equivalents. In other words:
ZV (German) = CL (U.S.),
SRU (German) = MVA (U.S.),
OSL (German) = OSB (U.S.).
